Automated reception and analysis of admission requests

QoreCapture revolutionizes the management of academic admission applications by simplifying the control process, thanks to its advanced functionalities.

The platform integrates automatic capture, document scanning and optical character recognition (OCR) to analyze various documents, such as passports, university letters, transcripts, birth certificates, curriculum vitae, etc.

It also ensures the conformity of these documents before transferring them to other systems.

Manual file import

Import any electronic document from QoreCapture's manual import window. You'll then be able to index them manually or using automated workflows.

Automatic import folders

Drop (manually or by system) any document into a network folder defined as an import directory by QoreCapture, and the document will be automatically added to QoreCapture.

Web Services

QoreCapture's Web Services API allows you to connect your EDRMS system directly to QoreCapture to set up a complete integration of your documents and their metadata.

Automatic Document Extraction and Reading (ADR)

Automated capture process, OCR and OMR extraction, barcode reading, and combination of automation with advanced Java Scripts.
